

Glid — Google Ads API Integration Design Document

1. Company Overview

Company: Glid

Website: <https://glid.studio>

Contact: hunzzang1126@gmail.com

Glid is a full creative design platform for digital advertisers. Users create display banner ads, social media creatives, and other visual content using a drag-and-drop editor with AI design assistance.

2. API Usage Overview

Purpose

We use the Google Ads API exclusively for **asset management** — uploading image assets (banner creatives) and text assets (headlines) from our platform to the user's Google Ads account.

API Endpoints Used

- `customers/{customerId}/assets:mutate` — Upload image and text assets
- `customers:listAccessibleCustomers` — List customer IDs accessible to the authenticated user

What We Do NOT Do

- We do NOT create, modify, or delete campaigns
- We do NOT manage ad groups, keywords, or bidding
- We do NOT access reporting or analytics data
- We do NOT modify account settings or billing

3. User Authentication Flow

1. User clicks "Connect Google Ads" in our platform settings
2. OAuth 2.0 redirect to Google consent screen
3. User grants permission for `adwords` scope
4. Authorization code exchanged for access/refresh tokens via server-side Edge Function
5. Tokens stored securely in Supabase database (encrypted at rest)
6. Refresh tokens used to maintain access without re-authentication

4. Data Flow Architecture

```
User creates banner in ACE Editor
↓
User clicks "Publish to Google Ads"
↓
Frontend renders banner to PNG (Canvas2D)
↓
PNG sent to server-side Edge Function
↓
Edge Function uploads to Google Ads API as Image Asset
↓
Optional: Headline text uploaded as Text Asset
```

Asset resource name returned and stored in publish history

5. Data Handling & Privacy

- **OAuth Tokens:** Stored in Supabase with Row Level Security (RLS). Users can only read their own tokens.
- **Image Data:** Rendered client-side, sent to Google Ads API server-side. We do not store images on our servers beyond the upload transaction.
- **User Data:** We only access the user's email (for account identification) and Google Ads customer IDs.
- **Token Refresh:** Handled server-side. Old tokens are overwritten, never accumulated.
- **Account Deletion:** When a user deletes their Glid account, all stored OAuth tokens are deleted via CASCADE.

6. Rate Limiting & Error Handling

- Each publish operation is user-initiated (no batch or automated calls)
- We respect Google Ads API rate limits and implement exponential backoff
- Failed uploads are logged and reported to the user with actionable error messages
- We do not retry failed operations automatically without user consent

7. Technology Stack

- **Frontend:** React + TypeScript (Vite)
- **Backend:** Supabase Edge Functions (Deno runtime)
- **Database:** Supabase (PostgreSQL)
- **Authentication:** Supabase Auth + Google OAuth 2.0
- **Hosting:** Vercel

8. Compliance

- We comply with Google Ads API Terms of Service
- We comply with Google API Services User Data Policy
- We maintain a Privacy Policy accessible at our website
- We do not sell, share, or misuse user data or API access
